Noveltec, Inc. offers you gene tests for canine mast cell tumor

● Gene tests for canine mast cell tumor

In mast cell tumors which more often in dogs, gene mutation in juxtamembrane region of c-kit receptor is detected in about 20% of cases. It is known that “imatinib mesylate (product name: Glivec®)” which is one of the molecular-targeted agent is extremely effective in these cases. This testing service detects the mutation of the specific region in the c-kit gene and determine effectiveness of imatinib mesylate.

Method	Fee (net of tax)	Reporting period
Electrophoresis	¥20,000-	In 1 or 2 weeks
Gene sequence analysis	¥30,000-	In 2 or 3 weeks
The charges are only for examining in juxtamembrane region of <i>c-kit</i> receptor		

Please pay through a bank transfer until the end of the next month when you received a bill.
